Design Brief

Prompt:
Plan a three-page design portfolio using my supplied album cover and studio environment assets. The homepage needs my name, the title **AI for Interdisciplinary Design Portfolio**, a canvas where users can click to create cartoon faces, and links to both projects. The album page should present the final album product and selected process image (iteration 1). The studio page should present the final product and the iterations to get to that product. Identify missing information. Wait before building.

On the album cover, I want the finished design first. I want the reader to be able to scroll down to the composition, comparison, and typography.

On the studio page, the main image introduces the space, followed by a short description [that I provide].

Design on first page:
“Click to add a face“ will be in small font in the upper left corner of the design canvas.

Both project pages need a clear way back to the homepage. The project links need descriptive names. These names are headings before the images of each project. The descriptive names for the two projects are as follows:

1. Album cover: “Badfish” by Sublime beach album cover.
2. Classroom space: 2030 discussion-focused classroom.

On the website, use the provided final album cover size for all album covers in the folder, including the first and second iterations. Preserve the classroom images proportions. Create optimized web copies where useful and keep the originals unchanged.

Title: “Badfish” by Sublime beach album cover

[Headline] Main image that I worked off of:

[Dad at the beach image]

[Headline] Iteration 1:

This was the first image the AI produced. I added driftwood, a CD player, a 40 oz Corona, and a surfboard to give it a beach vibe.:

[Insert Iteration 1 image]

My Thoughts After Iteration #1

1. The Corona bottle should have the Corona Extra label on it. It should also look like a 40 oz, being thicker than the current bottle.
2. The surfboard should be closer up, up against the driftwood. So it should only be showing ⅔ of the surfboard and the surfboard should be bigger. Keep everything the same other than that.
3. Even though I asked that the beer and the surfboard be the same distance from the CD player, I like it being offset a little. Width-wise, it seems as though the bottle is 5x closer to the CD player than the surfboard.
4. I forgot to add the song title and artist, which were a couple of requirements for this assignment, so I told the AI to put the words "Sublime" (the artist) in black and Old English font, covering the top 20% of the picture, with a smaller subheading, "Badfish" (the song name) also in black and Old English, right below it, being 50% of the size of "Sublime."

[Headline] Iteration 2/Final product:

Based on the edits I proposed on the last image, the AI created the second iteration of the image, which was the final product.

[Iteration 2/Final product image]

Title: 2030 discussion-focused classroom

[Headline] Iteration 1:

[Insert 2030 discussion-focused classroom iteration 1]

What I liked:

1. Codex created the space with beautiful plants in the background, a station for the teacher on the wall, and a wood-like design on the walls. I really enjoyed the small details that AI filled in — things that I didn't control.

2. The teacher's desk was very discreet. I didn't even think about making it a darker color. This was a great idea from the AI and is just another example of it performing well without specific direction.

What needs to be fixed:

Each edit will follow the format of editing AI images from "Spatial images and targeted edits" video: (1) What should the model produce; (2) What should be visible; (3) How should it be shown; (4) What constraints matter.

1. The size of the room looks like it's too small — the students barely have any room to get out of their chairs. However, this may be a sizing issue as well, as I didn't specify the size of the desks and chairs. Next iteration, I will be sure to specify the size of the chairs as four ft. tall and the size of the desks as three ft. I will also expand the room to 1000 sq. ft.

   Here is what I sent the AI:
   "This classroom should allow students to have plenty of room to get out of their chairs. There should be more space between the chairs and the wall. Due to this, change the room to be 1000 square feet and make the chairs four feet tall and desks three feet tall. Alter the other dimensions of the desks and chairs according to this change."

2. While the AI made a good point about the presentation screen being higher up so that it doesn't block eye contact, it had a few flaws. For one, the screen was too high up and may cause the students to put stress on their necks if watching the screen for long periods of time. Additionally, the screen looked to be broken up into 11 sections, one for each student and the teacher. I think that an individual screen for each student would be better in this scenario. To ensure that the screen doesn't block eye contact for discussions, it will descend to the ground once the presentation is over. Each screen will be stand-alone, supported by two thin columns on either side, and will be a foot in front of each student's desk.

   Here is what I sent to the AI:
   "Students should not have to crane their necks to look at a presentation on a screen. To solve this problem, the 10 students and the teacher should have their own personal screen that is 16 inches wide and 10 inches tall, each screen being stand-alone, at each person's eye level, each being supported by two thin columns on either side, and a foot in front of each student's desk. The screen is then programmed to descend to the ground once the presentation is over."

3. There needs to be more space between desks, since students need a place to set their backpacks. Because of this, I will tell the AI to add another two feet between each desk.

   Here is what I sent to the AI:
   "There should be more space between the desks for the students to place their bags. Each desk should be separated by three feet. Desks are still positioned in a circle."

[Headline] Iteration 2:

[Insert 2030 discussion-focused classroom iteration 2]

What I liked:

1. Each student and teacher has their own retractable screen at eye level.

What needs to be changed:

1. The students at the bottom of the image look as if nothing changed in the distance between their desks; however, there is a noticeable change in the distance between the two desks farthest from my point of view. I need the AI to make it look as if all the desks are three feet away from each other when I look at the image.

   Here is what I said to the AI:
   "It looks as if the desks at the bottom of the image are still closer than three feet away from each other; however, there is a noticeable change in the distance between the two desks on the far side of the room. Make it look as if all the desks are three feet away from each other when I look at the image."

2. The blue screens on some students' screens are not facing them. The AI needs to make sure that the blue screens are facing each student, even if, from my point of view, I see the black backside of their screen. Additionally, some desks were missing screens, so making sure every student has a screen in front of them is important. Finally, there should be a rectangular hole the same size as the screen at the very bottom of it — a spot where it can lower into when there isn't a presentation.

   Here is what I said to the AI:
   "Each screen should have a rectangular hole the same size as the screen at the very bottom of it — a spot where it can lower into when there isn't a presentation. Additionally, each screen must be facing its viewer; many of the blue screens seem to be facing away from the student. There should be a screen in front of every desk as well — 11 screens in total."

3. Some of the chairs of the students were still very close to the wall and didn't allow for much wiggle room to get out of them.

   Here is what I said to the AI:
   "I would still like to see more space between the students' chairs and the wall. Specifically, at least five feet. The chairs closest to the walls should be at least five feet away."

[Insert 2030 discussion-focused classroom final product]

Website design

I like the font size, font type, and colors seen in this website: About John Hydrisko | Communications Strategist — John Hydrisko . The one thing I would like to change is change all the grey colors to white.

The text explaining my thought process after every image iteration should be under the images themselves, taking up the same horizontal length as the image.

Spacing:
There should be an inch between each paragraph of text and each image and text.

Homepage:
Use a white background with black text — the same size and font text seen in this website: https://www.johnhydrisko.com/about. Only take the size and font of the text and the colors seen in that website, nothing else. The title of the website should be placed at the upper left corner. The title should read as follows:**AI for Interdisciplinary Design Portfolio**. Right below the title there will be a subtitle that is the same size and font as the title. This subtitle will read: Carlos Zuniga's Portfolio. ⅓ of the homepage should consist of the title and subtitle while the other ⅔ should consist of the interactive artwork.

Then, place the two projects below the interactive artwork. Projects should be stacked; one on top of the other. The first project shown should be the album cover, then the classroom. Separate the album cover and the interactive artwork from the home page with a horizontal line. The header for the album cover project and classroom project should be as follows and should be the same size and font as the website titles that I mentioned previously.There should be horizontal lines between each image iteration of both projects images and observations about the iteration. These horizontal lines should stretch from one end of the page to the next.

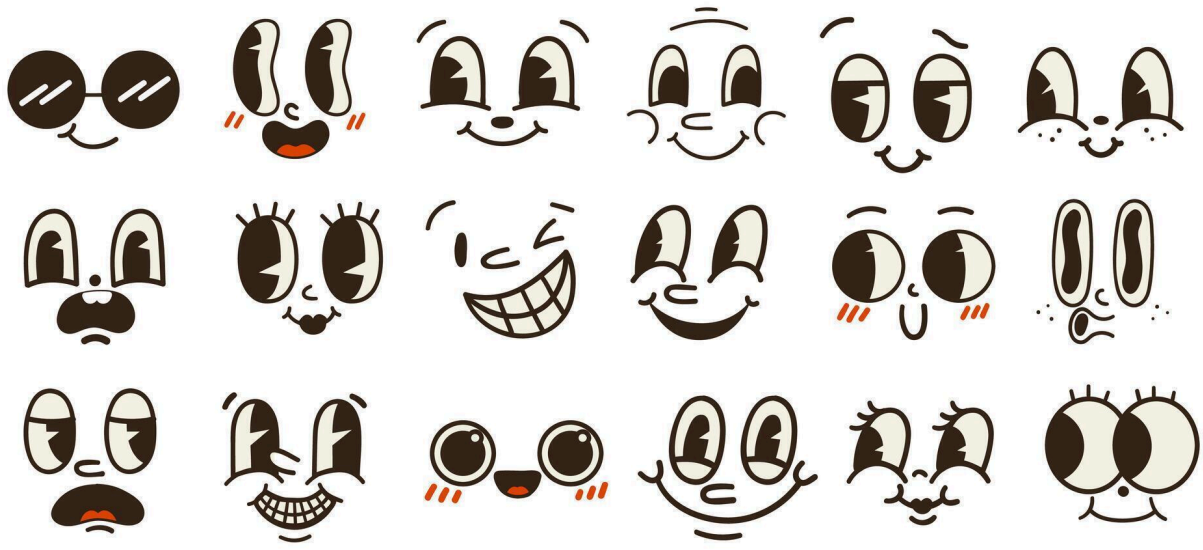

Use this reference to understand the spacing, format, and sizing of all the aspects of the website.

Here is an outline of the website I drew that matches what I have said above:

Interactive page

Use an HTML canvas and Javascript, with no external image generation service.

Prompt
Add an interactive drawing area to the homepage. When a visitor click or taps in the area, draw one cartoon face at the position randomly selecting one of these:

Rules for the cartoon faces:

1. Users can add either add a face to the canvas by clicking on the canvas with their mouse, taping their phone screen — wherever the user taps/clicks is where the face will appear.

2. There should be 20 faces max on the canvas at one time and they should all stay on the canvas. The canvas removes the oldest face every time you add a new face past the 20 face limit. There may be more than one of the same face on the canvas at once.
3. In terms of sizing, faces should take up 5% of the canvas.
4. Individual faces should be the exact same as they appear above.
5. Do not add a button to add extra faces — the only way to add faces is to click on the canvas. Include a short description in the upper left corner that says “Click to add a face.”

Technicalities:

1. Use an HTML canvas and Javascript, with no external image generation service
2. Each visit to the page there are three randomly placed faces already on the canvas.
3. There is no saving of the previous faces one draws — each new visit begins a new set of three randomly placed faces.
